## Flow velocities of Alaskan glaciers

Since Doppler lidar may help to designate aerosol passive tracer air motions that are immune to terminal velocity air density corrections at altitude, longer-term analyses of joint Doppler lidar and 95-GHz spectral datasets in appropriate rain conditions provide one path for exploring W-band retrieval accuracy and better interpreting altitude corrections as in.

## Direct estimation of the global distribution of vertical velocity within cirrus clouds

BEAUFORT SCALE - a scale that indicates the wind speed using the effect wind has on certain familiar objects. ANTICYCLONE- A large area of high pressure around which the winds blow clockwise in the Northern Hemisphere.

## The link between Tibetan Plateau monsoon and Indian summer precipitation: a linear diagnostic perspective

The mosaicked vector field for each mountain range is interpolated onto 90 m UTM grids using a second-order polynomial regression with a search radius of 900 m. A similar analysis was performed for the region with the highest temperature anomalies during the June HW southeastern France, Supplementary Fig.

## State of the tropical Pacific Ocean and its enhanced impact on precipitation over East Asia during marine isotopic stage 13

Squares and solid lines are for winter data and diamonds and dashed lines for summer data. This threshold for extreme precipitation is similar to that used in to study zonally averaged changes in extreme precipitation.

**Meteorological Characteristics and Overland Precipitation Impacts of Atmospheric Rivers Affecting the West Coast of North America Based on Eight Years of SSM/I Satellite Observations in: Journal of Hydrometeorology Volume 9 Issue 1 (2008)**

Attribution analysis of high precipitation events in summer in England and Wales over the last decade.

### **Distinct influences of large**

DIGGING- Deepening, becoming more amplified with time. Changes in impacts of climate extremes: human systems and ecosystems.

### **Direct estimation of the global distribution of vertical velocity within cirrus clouds**

Here we have dissected these events with recently developed tools to provide an assessment of different relevant factors: i the role of the dynamics synoptic setups associated with the 2019 HWs ; ii underlying physical processes warm advection vs. As a result, a stronger southerly wind component characterized this first HW, when compared to relatively more stagnant conditions during the late July episode.

### **Flow velocities of Alaskan glaciers**

As discussed in the introduction, the existence of ice and supercooled water in the mixed-phase region is essential for cloud electrification. Streamlines are plotted in gray south of 30°N. Widener , , and B.
