The Cretaceous carbonate platform in Israel

Stratigraphic packaging of phosphatic strata indicates that temporal variations in storm frequency were a prerequisite for the formation of economic phosphorite.

REPLY, Sedimentology

This chapter brings to light the critical role an increase in storm frequency and intensity has in forming thick amalgamated phosphorite beds. Salinity stratification in the Permian Phosphoria sea; a proposed paleoceanographic model. Certain cyanobacteria help to form rigid biogenic structures such as stromatolites and stromatolites.

Sedimentary response to basin inversion: Mid cretaceous

Thus, NMR relaxation measurements have a direct phys. Hermon Hirsch, 1996; Picard and Hirsch, 1987.

Formation of the Upper Cretaceous cherts in northeastern Sinai, Egypt

The study provides new information on the nature and timing of sedimentation, diagenesis and penecontemporaneous folding in mixed silica, coccolith ooze and phosphorite precursor sediments, below and above the hardground surfaces.

Two close associations : Si

The shelf is characterized by alternating well oxygenated bottom waters and poor oxygen content indicated by low-oxygen tolerant taxa. In the study of water adsorbed on silica gel, two hydrogen relaxation centers were recorded.

Petrogenesis of a Senonian barite deposit, Judean Desert, Israel

A re-evaluation of the spatial and temporal distribution of sedimentary phosphate deposits in light of plate tectonics.
