The restless earth

This magma finds its way to the surface, creating volcanoes. The oceanic plate descends under the continental plate because it is denser.

Earth Revealed

It is the jostling of these plates that causes earthquakes and makes mountains. This was the thickest layer 10mm. To avoid compounding natural disasters, we need to aggressively tackle climate change.

This Restless Heart Poem by Alexander Thomas

Draw lines from these 4 boxes to the correct place on the earth.

The restless earth

The magma comes from a plume.

The restless earth

The currents in the mantle, in turn, push up against the light, brittle rock of the crust. When plates squeeze or stretch, huge rocks shift making faults and causi. Therefore, at this place the plates are pulling apart, pushing together and sliding past one another.

Junior Cert Geography

To know 4 plate boundaries. The surface is divided into several major crustal plates, layers of light rock 30 to 100 miles 48— 160 km thick floating on top of the Earth's heavy, iron-rich mantle.

Junior Cert Geography

CHALLENGE: What would happen if a continental plate and an oceanic plate collided? Almost all past failed human civilizations succumbed to drought, disease, and other disruptions to delicate natural support systems.
