Newer agents that are currently in development include , , and in which the latter have reached clinical trials. XX with permission from the Centre National de la Recherche Scientifique CNRS and The Royal Society of Chemistry. Studies show that para-substituted derivatives are more potent anticorrosive agents than ortho-substituted compounds, and nitro-derivatives are better inhibitors than amine homologues.

Since the binding is competitive and reversible these agents have the potential to achieve faster inhibition of acid secretion and longer duration of action compared to PPIs, resulting in quicker symptom relief and healing. In method B, a thin layer of 1 μ L of synthetic matrix material solution was made on a target plate and then 0.
