It is also not a park; you will not get any other entertainment apart from collecting fossils. . The smallest species are presumed to have been part of the free floating plankton, while the more common, mid-sized species probably walked along the sea floor filtering mud to obtain food, and the larger varieties may have been swimming predators.

Placoderm

Due to these fins and other features, coelacanth was once thought to be the most recent shared ancestor between other bony fishes and land-dwelling vertebrates tetrapods. They are not expensive, and you will not get any resell value but will surely enjoy the hunt.
