## Formatting Numbers and Dates (Report Builder)

The period is the default value of SET CONCAT. The Print Delay command allows you to go back and change the value of an output variable before printing.

## Data Mining Clustering Example in SSAS

The key feature of SQL++ that makes this possible is the GROUP AS clause.

## Getting Asterisk Connected to MySQL via ODBC

This method significantly improves the performance, but also simplify table joins. In case of a column combination, the columns must be concatenated. This allows display formats to be altered without any internal value loss.

## ReportServer

It offers a full range of SQL training from introductory courses through to advanced administration and data warehouse training — for more details. A format trigger can be used to dynamically change the formatting attributes of the object. Variables change type as required.

## PL/SQL

The implicit iteration variable serves as the object-name for all field-names in the query block that do not have explicit object-names. The FROM clause produces a stream of binding tuples, each containing two variables, c and o.

## AsterixDB

Note that circular dependencies, in which a column references another column which in turn references the first column, either directly or indirectly, are not allowed. The SQR HTML hypertext link procedure allows us to specify links to other parts of the current web page or to an external web page. Execution Stage · Actual program execution takes place only if SQR finds no compile errors in the source program.

## **Structured Query Report**

Each parameter needs to be declared with both the parameter name from the SSRS report and the value you intend on using.
