Tranquilizer Use And Well Being A Longitudinal Study Of Social And Psychological Effects Research Report Series PDF Book

There has been a lack of consensus on the impact of online social network use and well-being, no doubt because of the complexity of these associations but also because of the difficulties inherent in measuring social media use and assessing impact using observational studies such as ours. This allowed us to directly compare the longitudinal associations of real-world network associations and Facebook use associations with 4 domains of well-being: self-reported physical health, self-reported mental health, self-reported life satisfaction, and body mass index BMI.

Social media use and well

Online social network Facebook use is represented by the 4 left bars and real-world network interaction is represented by the 3 right bars with horizontal shading. Those respondents were different from those who did not. With the ubiquity of social media, important questions have arisen about the impact of online social interactions.

Models controlling for degree and closeness The results for our Facebook use predictors could potentially be the result of confounding. The

inclusion of degree did not change any of our results. Among the real-world relationship measures, the number of friends nominated in wave t predicted life satisfaction in wave $t + 1$ after we controlled for life satisfaction in wave t .
