**Iron Truss Bridges for Railroads**

**Category: William Emery Merrill**

Research interest in the repair and rehabilitation of existing infrastructure continues to grow, particularly in Europe and North America, while the challenges to protect human life and property against the effects of fire, earthquakes and other hazards are being addressed through the development of more appropriate design methods for buildings, bridges and other engineering structures. Significant savings in weight as high as 50% have been realized with open-web girders designed to have the required moment of inertia.

**Welding information system : design, operations, methods**
