Using an experiment in a public opinion survey, we test the source content and credibility hypotheses to assess how much confidence people have in reports about scientific studies of the safety of offshore oil drilling along the California coast. These are mainly trees, corals, ice cores, rare marine cores and laminated lake sediments. Back trajectories and wind dependent and PCA analyses showed that the marine sources included ship traffic emissions and corrosive stainless steels from the equipment at the platform as well as industrial emissions from stainless steel production and coal combustion sources, which were transported from the surrounding mainland.

A total of 3545 patients with STEMI were admitted in the Bremen Heart Centre during this time period. It can be found that the posture of the magnetic beacon will impact the remote positioning precision within valid positioning range, and the positioning accuracy is higher with longer baseline for limited space in drilling tools. Much of the overlying 294 m of mud was found to be laminated, thus these sediment cores will provide a unique 1 million year record of tropical climate change in continental Africa at extremely high resolution.
