In the wet collodion process, silver nitrate reacted with a halide salt; potassium iodide, for example. The process was also very fast for the time, requiring only a few seconds to expose an image in daylight, rather than 30 seconds or more for other forms of photography available in the mid-1800s. It may then be used or washed, as outlined below.

## Collodion process

It would lose effectiveness, causing plates to mysteriously fail to reproduce an image.
