## Effect of computer system performance and other work Stressors on strain of office workers

Those frequently working in pain are more likely to have clinical CTS. A more severely protruded head causes a more decreased angle of cervical flexion Angle B and an increased staring angle Angle A ; thus, Angle B-A is reduced. All symptomatic subjects were examined by the same physician who was experienced in performing relevant assessments of CTS.

### [Survey on visual and musculoskeletal symptoms in VDT workers]

This paper explores the relationships between extent of video display terminal usage, perceptions of the physical work environment, task characteristics, and workers' health and well-being among a group of 1032 female office clerical workers.

## The Effect of The Forward Head Posture on Postural Balance in Long Time Computer Based Worker

Screening the participants revealed that heavy computer users were mostly office workers, and their usual exercise levels were not included; this may have resulted in a potential screening-related error.

## Work Environment and the Well

The LOS test for motor control ability evaluation is a program to assess subjects' abilities to move their COG to fixed target points in a total of 8 directions: front, back, right, left, and each diagonal direction with five parameters of reaction time, movement velocity, directional control, endpoint excursion, and maximum excursion. With a block-randomized design, the subjects responding to this survey were limited to those located in the buildings chosen throughout the city, which might lead to selection bias. WYI, LLA, PP and YW helped with the interpretation of the data.

## The Effect of The Forward Head Posture on Postural Balance in Long Time Computer Based Worker

Likewise, BMI was associated with the presence of wrist and hand symptoms in the univariate regression; however, it was not significant in the multivariate model adjusted for age and gender.
