**Neoproterozoic (~ 600 Ma) aggregation of Western Gondwana: a tentative scenario**

The different size fractions are stockpiled in marked, allocated areas.

**Time of emplacement and metamorphism of Late Precambrian mafic dykes associated with the Pan**

Flowers somewhat stellate, glistening white, in a laxly spreading cluster, tepals occasionally with undulate edges, stamens shorter than tepals.

## Full text of African field

Exploration at Chambishi Southeast has sporadically taken place since 1903, with the main discovery drilling from 1975 to 1982. Leaves 2, dry at flowering, spreading, narrowly strap-shaped, slightly channelled, smooth or with short, out- 40 AMARYLLIDACEAE TRELITZIA 30 2013 spread hairs on both surfaces or under surface.

## Neoproterozoic (~ 600 Ma) aggregation of Western Gondwana: a tentative scenario

Leaves distinctly grey,  $\pm$  0.
