Nucleus and cytoplasm : Harris, Henry, 1925

At 18 h, GVs were isolated, and protein G-Sepharose beads were used to immunoprecipitate mAb 9E10.

Rows 5,6: a chase at 37°C also reduces ratios, whilst one at 4°C gives less reduction. Protein synthesis consists of two stages: transcription and translation.

What is the Relationship Between the Nucleus and Cytoplasm?

The mRNA leaves the nucleus via nuclear pores and goes to the ribosome. Small nuclear ribonucleoproteins and heterogeneous nuclear ribonucleoproteins in the amphibian germinal vesicle: loops, spheres, and snurposomes. The tagged protein was synthesized in vitro in a coupled transcription—translation reaction and was detected with mAb 9E10, which is specific for the c- myc epitope.

Most Human Proteins Made in Both Nucleus and Cytoplasm Turn Over within Minutes

In vitro transcripts encoding myc-tagged coilin were injected into the cytoplasm of 100 oocytes, which were incubated in OR2 saline for 24 h to permit translation and accumulation of tagged coilin in the nucleus. The amino acids are what ultimately make up proteins.
