Asteraceae: Aster, Sunflower Family. Identify plants, flowers, shrubs, trees.

The variation in ray and disk flowers and the size of the head is astonishing. The fruit is a specialized type of achene called a cypsela. They are sessile or on short peduncles.

Classification

The pollen is then pushed out of the anther cylinder by the tops of the style branches. In fact, although easy to recognize at the family level, such variation within the family make composites the bane of many botanists seeking to identify the plants to species: DYT or DYC is their acronym signifying their frustration at taking the plant to the species level — Damn Yellow Things or Damn Yellow Comps.

Classification

It is covered with white-woolly hairs, typical of the everlasting tribe Inuleae of the sunflower family Asteraceae. They form the central disk of the capitulum in typical daisies.

Asteraceae, Brassicaceae And Poaceae

Which plants are responsible for compositae allergy? The young, pink roots numb the tip of the tongue when chewed.
