## 1990s

Drug misuse costs comprised the majority 83% of substance misuse treatment costs mean £4 107 650, sd 3 398 499 with costs of alcohol misuse treatment considerably lower mean £108,042, sd 694 558. However, as it was not designed explicitly for these purposes, some limitations exist.

### Explaining Variation in Hospital Admission Rates between General Practices: Cross Sectional Study on JSTOR

Conclusions A number of areas have been identified as regional priorities.

### Using HIPE data as a research and planning tool: limitations and opportunities

The age-standardized model for combined drug and alcohol misuse costs had an adjusted R-squared of 0. Separate analyses were therefore performed for over-18s and under-18s. Methodological advances have addressed the extent to which utilization data reflect access to healthcare, rather than need for healthcare.

## 1990s

Within a drugs-only model a higher adjusted R-squared 0.

## 1990s

Contributed by Contributors: AG, HG, and MR developed the study and wrote the paper jointly, with AG contributing particularly to the econometrics, HG to the modelling, and MR to the clinical input. We also included area-level needs variables stratified by age group.
