ICNAF

December 1972, vi + 80 p. The influence of fresh waters rich in silicic acid, among other nutrients, from high river discharges due to glacier melt and heavy rain, fertilize the photic zone by mixing with macronutrient-loaded oceanic deep water ,,,,.

Advances in herring biology: from simple to complex, coping with plasticity and adaptability

CalCOFI data show that anchovy larvae appeared to increase from the end of 1960s to the early 1970s, abundance became low in late 1970s until a peak in the mid-1980s, after which larval abundance returned to relatively low levels Fig. From a management perspective, it would therefore make more sense to manage towards a specific selection pattern for which depending on the balance between yield and stability clear targets can be defined instead of towards an age structure for which at least this study has not provided any potential targets and which is known to vary strongly due to environmental variability.

ICNAF

The duration of unconsciousness depends on the electrical parameters of the stun, the duration of electrical application, and on post-stun treatment. Analytical limitations relate to the absence of comparisons of alternative models that discriminate between constant and varying mortality but see —. Is age structure a relevant criterion for the health of fish stocks? Ecological effects of climate fluctuations.

NMFS Scientific Publications Office: Legacy Series: Circulars

Hence, resilience was expressed as the number of years to first reach TEP MSY after an instantaneous decrease in fishing mortality from F lim to F MSY at a specific selection pattern a higher resilience being associated with a shorter recovery time. Fishing gear was consistently deployed 10 m

from the shoreline. To further account for multiple data sets from the same study site i.

April 1970, iii + 19 p.

ICNAF

January 1966, iv + 57 p. For the most part, variations attributable to paternal contributions are not included in fishery-dynamics models.

Application of Enclosures to Studies on the Early Life History of Fishes

Appalachian sport fishery investigations, by Robert E. June 1967, iii + 15 p. The number of intact American shad *Alosa sapidissima* Wilson larvae eaten in laboratory experiments was estimated by extrapolating the regression for the amount of food in the gut over time for predators of various size.
