the strength—ductility trade-off.

Fundamental electronic structure and multiaatomic bonding in 13 biocompatible high

The accurate determination of PC is extremely important in interpreting many of the material properties and their functionality, especially in HEAs. Therefore, strain and stress are homogeneous and are represented in terms of symmetric second-rank tensors indicated by the bold font below.

Determination of elastic constants of titanium diboride (TiB₂) from first principles using FLAPW implementation of the density functional theory

Observations: 1 M1 has the highest TBOD of 0. Overall, the agreement with the limited experimental data is quite reasonable and consistent, especially for M6 and M9.

First

Additional testing with selected sample for higher k-point showed no discernable difference. Some of the general trends are discussed in the figure caption.
