Our results also highlight a problem with Pearce et al. The Lachlan Fold Belt and the Strona-Ceneri Zone are according to Zurbiggen attributed to the setting of subduction—accretion complexes.

Pre

Indeed, have you noticed how fine-grained these mafic blobs are? Relicts of anthophyllite and cummingtonite pre-date the replacement by talc.

The Pre

The Alps are a single geographical and geological entity, yet they also constitute a culturally and climatically very diverse region. But from a general perspective of subduction—accretion tectonics of the Ordovician orogeny Zurbiggen they cannot serve as main setting due to following reasons: A clear ubiquitous ophiolite stratigraphy is lacking and obduction is the exception rather than the rule in accretionary complexes.

Pre

Type 3, Ceneri gneisses represent inclusion-rich diatexites, which are characteristic for such gneiss terranes Zurbiggen.
