

Significance of debridement in endodontic therapy

University of Toronto, Faculty of Dentistry - Endodontic microbiology / dental implant courses

Treatment Considerations/Prognosis		
Favorable	Questionable	Unfavorable
Nonsurgical Root Canal Treatment:	The etiology for failure of the initial treatment can be identified	The etiology for failure of the initial treatment cannot be identified and cannot be identified and corrected with nonsurgical retreatment
Mixed Canal	Nonsurgical endodontic retreatment will correct the deficiency	Nonsurgical endodontic retreatment may not correct the deficiency
Surgical Root Canal Treatment:	The procedure is uncomplicated	Canal debrided and obturated by the procedural complication there is no apical pathosis and the patient is relieved on recall examination
Altered Anatomy (e.g. loss of length, apical transportation)	can be corrected with nonsurgical treatment, retreatment or apical surgery	The patient is symptomatic or a lesion persists at the procedural complication, apical pathosis and the patient is relieved on recall examination to undergo apicoectomy/ interventional reparation
