10.2: Introduction to Valence Bond Theory

In the ground state of the free carbon atom, there are two unpaired electrons in separate 2p orbitals.

Band Theory

Vroom has focused much of his research on dealing with motivation and leadership within an organization.

Vroom's Expectancy Theory

Validation studies have shown that between-subjects designs result in lower prediction validities.

Band Theory

This is the quantity of energy released when the bond is formed. From a leadership perspective it means that you need to connect with your people and create potential rewards intrinsic or extrinsic that they value, that you need to set stretching but achievable goals for your people and that you need to be honest and trustworthy.

Lawler and Porter's Modification to Vroom's Expectancy Theory

The positive lobe is indicated in yellow, and the negative lobe is in blue. Perhaps the most common and important example of this bond type is methane, CH₄.
