Production of hydrogen

Only in the 18th century the English noun fossil gradually started to refer to the modern and in use today long-dead organisms.

Where our natural gas comes from

Today, only few cities including London have retained gas street lights, often to preserve their historic character. Ethane is often used to get ethylene and polyethylene, which are the base feedstocks for the production of packaging, wires, insulation, and many other plastic-like products. As it turns out, there are very few technological barriers to overcome.

Coal gasification

Carburetted Water Gas CWG , developed in the 1860s, is BWG enriched with gases obtained by spraying oil into a hot retort.

Production of hydrogen

The process of manufacturing gas usually produced a number of by-products that contaminated the land and in and around the manufacturing plant, so many former town gas plants are a serious concern, and cleanup and remediation costs are often high. This source documents the rapid growth of local gas and electric utilities to provide light, and later other uses, in Upstate New York in the last half of the 19th century.
