## Conifer root and butt rot caused by *Heterobasidion annosum* (Fr.) Bref. s.l., Molecular Plant Pathology

Hardiness: Is it prone to attack from pests and diseases, is it readily affected by pollutants, etc? In addition to branch growth, buds are responsible for flower formation and leaf production.

## Growth and Development of Natural Seedlings of Abies and Tsuga in Old

Similarly, the low number of germinated spores relative to the total number of adhered spores could indicate that not all spores were viable or that the storage nutrients on individual spores necessary to initiate germ tube growth were insufficient.

## Tree Root Systems

By contrast to observations with fine roots, pretreatment of wood discs with di-ethyl ether had no effect on spore germination as the results were comparable to control values with or without treatment. To help prevent damage, keep roots covered and moist from the moment seedlings are removed from their shipping bundles until they are planted.

## Tree Root Problems

These plants are drought tolerant and will grow in dry areas and perform beautifully. In general, the pattern of performance that emerged with both species was strong positive responses to the presence and quantity of organic soil components and a strong negative response to competition.
