## Road Crime Control and Reporting System for Public Service Vehicles in Developing Countries: A Case of Kenya

Results and Discussions After the interconnection of the sensors in the vehicle, the driver should be able to see the number of seats occupied and the number of seatbelts fastened. It presents a way of monitoring the passengers and drivers remotely. The additional information collected that includes brief video footages of the passengers entering the vehicle together with sound recording when needed, the driver, GPS location and frequent photos of the people seated in the vehicle data will be collected and maintained at a remote location.

## Practical Challenges and Perspectives for the Development of Neurosurgery in a Peripheral East African Hospital During a One

This will also ensure that the vehicle can be actively tracked for more advanced system functionality. Decision support systems: concepts and resources for managers. The second part involved identifying how these cases come up and how they can be avoided.

## Implementing road transport safety measures in Kenya (2007 edition)

Drivers who drive tired or exhausted are mostly sleepy, agitated and aggressive on the roads. Although there has been equipment installed on vehicles to either cut the fuel supply so as to reduce the speed, additional sending of information to law enforcers will be done if the speed exceeds for a defined duration of time without reduction.

## Practical Challenges and Perspectives for the Development of Neurosurgery in a Peripheral East African Hospital During a One

This paper examines the implementation challenges and emerging policy issues relating to the new road safety measures taken by the Kenya Government through Legal Notice No. Seat occupancy sensors were to identify seat occupancy and compare with the condition of the safety belt switch to notify the driver the seats that are occupied and seat belts not engaged. Public Safety Messages This is an approach where the passengers are expected to send a text to some central number whenever traffic rules are defaulted.

This led to the identifying the modules that would be required to represent the causes and connect them together in a system. It will be up to the driver to ensure that all the occupants are belted in before driving off and that the vehicle is not overloaded.

## **Road Crime Control and Reporting System for Public Service Vehicles in Developing Countries: A Case of Kenya**

The relevant sensors will be installed in the vehicle. The system incorporates a number of networked sensors that collect information related to road usage crimes that includes images and send the information to a central server for processing via a GPS tracking device. After the information has been uploaded to the central server, the system will notify the owner of the vehicle of the happening via text and then liaise with a database for ticketing the defaulter and deducting points from the driver who committed to the crime.

Equipment for collecting information was identified and means for transferring this information was also defined. The paper begins with an introduction which provides the context of the study, overview of road transport, theoretical framework and methodology. Conclusions The model proposed should be considered a preliminary and immersive survey to evaluate the eligibility of a decentralized East African hospital to interface with neurosurgical activities, through the support of experienced local institutes and Western organizations.

There are multitude of possibilities to exploit but only those conforming to the above stated points will be considered.
