book is an introduction to graph transformation as a foundation to model-based software engineering at the level of both individual systems and domain-specific modelling languages. As a matter of fact, within the area of graph grammars, graph transformation is considered as a fundamental computation paradigm where computation includes specification, programming, and implementation.

Besides serving as prerequisite for describing the applications in the second part, it also provides a comprehensive and systematic survey of the concepts, notations and techniques of graph transformation. Emphasising the research and engineering methodologies used, it will be a valuable resource for graduate students, practitioners and researchers in software engineering, foundations of programming and formal methods. It also presents implemented specification languages and tools, and structuring and modularization concepts for specification languages.

Finally, the third part summarizes experiences gained in actual projects employing model-driven development. Besides serving as prerequisite for describing the applications in the second part, it also provides a comprehensive and systematic survey of the concepts, notations and techniques of graph transformation. These papers mirror the wide-ranged ongoing research activities in the theory and application of graph transformation.

This volume is accompanied by a CD-Rom containing implementations of specification environments based on graph transformation systems, and tools whose implementation is based on the use of graph transformation systems. The scope of the conference concerned graphical structures of various kinds like graphs, diagrams, visual sentences and others that are useful to describe complex structures and systems in a direct and intuitive way. The Software Engineer at Diffbot plays a critical role in advancing the efficiency and scalability of this machinery.

The 25 revised full papers presented together with an invited paper were carefully reviewed and selected from 105 submissions. All current aspects in graph drawing are addressed including graph theory and graph algorithms, theoretic and semantic aspects, modeling, contributions to software engineering and global computing, applications to biology, and tool issues. The 24 invited reviewed papers are written by students and collaborators of Hartmut Ehrig who are established researchers in their fields.
